SI Session: June 26th Mondays – Thursdays 12:30 PM – 2:00 PM Room 1229 Prof. Stockton : Calculus I Summer I 2008 SI Leader : Neil Jody

[1] If
$$x = \tan y$$
, calculate $\frac{d^2 y}{dx^2}$.

[2] Find the absolute maximum and minimum values of $f(x) = x - 3x^{\frac{2}{3}} + 4$ on the interval $\left[-8, \frac{125}{8}\right]$.

[3] Find the absolute extrema of the function $f(x) = \frac{1}{2}\cos 2x + \sqrt{3}\sin x$ on the interval $[0,\pi]$.

- [4] The graph of the *derivative* of a function *f* is given below. Use the graph to determine each of the following:
 - (a) the relative maxima of f(b) the relative minima of f \leftarrow $\begin{pmatrix} & & \\ & & & \\ & & & \\ & & \\ & & & \\ & & \\ & & &$

[5] Find an equation of the line tangent to the graph of $y^3 - x^2y + 4x = 7$ at the point (-2,3).

[6] Find the open intervals on which $f(x) = \frac{12x}{x^2 + 4}$ is increasing or decreasing, and find the relative extrema.

[7] Find the intervals on which the function $g(x) = 3x^5 + 10x^4 - 7$ is concave up or down, and identify any inflection points.

[8] For the curve given by $y^2 + x^2y^3 + 11 = 4x$, find an equation of the tangent line at the point (2,-1). Write the equation in the form y = mx + b.
